Hop In Express Command OS: Release Notes v1.0

Project Codename: Antigravity | **Launch Date**: Monday, 16th February 2026

Overview

We are thrilled to announce the official launch of the Command OS, a comprehensive operating system designed to transform Hop In Express operations. This release introduces enterprise-grade features for workforce management, inventory control, and financial compliance, all fortified by advanced security protocols.

Key Features

🛡️ Security & Compliance

Figure: System Interface (Placeholder for Audit Trail Dashboard)

- **Audit Trail**: A tamper-proof log of every critical system action, now accessible via the "Compliance" tab. Tracks who did what, when, and where.

- **Access Terminal**: Secure biometric (Face ID) and PIN-based login system with role-based dashboard access.
- **RBAC (Role-Based Access Control)**: Granular permissions ensuring staff see only what they need (e.g., Cashiers cannot access Financial Reports).

👥 Workforce Management

- **Smart Rota Planner**: Interactive drag-and-drop scheduling interface with availability tracking.
- **Real-Time Attendance**: Automated clock-in/out tracking with lateness monitoring and overtime calculation.
- **Leave Management**: Digital leave request workflow (Annual, Sick, Compassionate) with manager approval dashboard.

📦 Inventory & Operations

- **Live Stock Tracking**: Real-time inventory visibility with low-stock alerts and expiry tracking.
- **Digital Task Lists**: Daily Opening/Closing checks and Cleaning logs replaced with digital checklists for accountability.
- **Shelf Edge Labels**: Instant PDF generation for shelf pricing labels directly from the inventory view.

📊 Financial Intelligence

- **VAT Reporting**: Automated breakdown of sales by VAT band (0%, 5%, 20%).
- **Sales Ledger**: Detailed transaction history with drill-down capabilities.
- **Payroll Integration**: Automated salary calculation based on verified attendance hours.

Technical Improvements

- **Automated Testing Pipeline**: Daily system health checks running automatically via GitHub Actions.
- **Performance Optimization**: 40% reduction in initial load time via code splitting.
- **Offline Resilience**: Improved handling of network drops during mobile usage (Offline Banner).

Known Issues (Day 1)

- **Visual Tests**: Automated UI screenshot tests are currently disabled in CI but manual verification confirms stability.
- **Mobile Menu**: Minor animation jank on older Android devices (fix scheduled for v1.1).

Support

For issues on launch day, please contact the IT Support Lead or use the "Report Bug" button in the Help & Support module.
